One touch voice recorder android

For some reason, the iPhone has tons of different voice recording apps, but very few of them do anything more than Apple's free voice memos app. We only love peak journalism because it manages to make itself worth its asking price by offering a different experience and feature set than Apple's IPO. Just click on the recording platform: iPhone (and iPad/Apple Watch/Mac)Price: \$4.99Lord pageFeatures One recording from the app, Message Center, or your home screen backup and syncAbility to share notes with any other app that supports audio or text sharing for multiple languages with support for fully searchable Mac app punctuation commands (\$4.99) for unlimited desktop sync recording time as long as your device allows background recording if you switch to another app, multitasking support on iPadWhere It Excels as the name suggests, When you open Just Click Recording, a large record button is displayed. Click this button and the app will start recording. It's simple, fast and easy, and that's exactly what you want here. Beyond that, Just Press Record does everything it can to simplify the process of recording an audio memo. This means you can start recording a memo immediately from your lock screen with a widget in the message center, with a hard click on the icon from your home screen, or straight from the Apple Watch.Just Press Record is also the only option we found that includes transcription software, and while it's about as accurate as a voice dictation on Siri, it's a welcome addition nonetheless. If you're one person speaking clearly into the iPhone's microphone, only peak press does a solid job of transcribing, but it gets confused if you're trying to record a group of people. The transcript isn't just useful for translating sound into text, it flips it over so you can search the voice recordings just like you make a word document. It alone is worth the price if you do a lot of voice memos and have no interest in organizing them manually. Where it falls short the only record press feature is missing compared to other options is editing features. Depending on why you use voice recording software, it might be a deal breaker, but if you just need a way to make quick memos or to record lectures, editing isn't usually necessary. Just Press Record also assumes that you want to search transcripts to find what you're looking for and don't offer much in the way of organizing other than putting files into specific folders for a date. It can be a deal breaker for anyone hoping to organize files in a specific way. At \$5, only peak journalism is expensive, but transcriptions make it worth the cost of admission. While there's plenty of voice recording app out there, most don't offer much more than Apple's own voice memos (free) app. In fact, voice memos is great for most people. With this, you can quickly record memos, trim them with lightweight And catalogue them in any way you see fit. If that's all you need to do, then the free app already on your phone is more than enough. Voice Recorder (free |\$1.99) is easily the most popular third-party voice recording option in the app store and it's a solid app for anyone looking for a slightly upgraded version of voice memos. It offers the basics, including unlimited recording time, basic editing, and audio loop capability. In addition to this, it has several solid organizing options, including organizing recordings into a traditional folder structure. You can also back up recordings to several different cloud services or password protection memos. If you don't care about Just Press Record transcription and search functionality, but you still need something more than voice memos, a voice recorder is a solid recorder in the middle that also adds some excellent organizational tools. If you don't need a dedicated voice recording app, both Evernote (free) and OneNote (free) have voice recording options where you can attach voice recording to any note. It's great for students recording lectures or if you're recording notes for a meeting. The recording process for both is slightly buried, so if you no longer use any app for your notes, they're not worth it just for audio memos only. Your smartphone can double as a diktap. Point your device at the speakerphone and record meetings, lectures and interviews. Google Play has plenty of great voice recording apps, but Cogi rises to the top by identifying the key needs of speech recording better than other apps. Cogi – Notes & Voice Recorder Platform: Android Price: Free download page Tap-to-record page and tap-to-hang interface allows you to record the main points. You can always set to listen without recording. Can record endlessly, until you run out of phone storage. Rewind 5, 15, 30 or 45 seconds of tap time, so you capture what's said before you tap. Share recordings using Dropbox, Google Drive, Evernote and email. Write notes as you record. Take a picture while recording. Add tags and contacts to an audio file for easy reference. You can record when you turn off the screen, or when you use another app. When it excels Cogi takes a different approach to the traditional tape recorder. It takes some getting used to, but it's worth learning the ropes. You can use it as a regular recorder by double-tapping the primary button, but Cogi intends to record only the highlights, not all of the speech. Tap first to start a new session, followed by Cogi listening in the background. When the speaker says something interesting, tap the screen to highlight that part (indicated by the swirling dial in orange). This bold audio clip will also include the last 5, 15, 30, or 45 seconds of audio, depending on what you've chosen in your app's settings. Tap again to stop recording. This way, you can use the app for extended recordings without worrying about running out of space, and more Captures the bits you want to listen to later. In addition, it detects that hearing doesn't cover everything in a meeting or lecture, so it has built-in tools for writing notes in a session or capturing the whiteboard using your phone camera. When you're done, review each markup individually, or start the entire session. You can also tag the session with labels or contacts assigned from your address book to an easy category - your contacts are for your reference only. You can rename each session and highlighted individual audio videos on different services. Perhaps most importantly, Cogi offers it all completely free, without obligation. Where it falls short Cogi is not without problems. It records only high-quality audio and does not allow you to select formats or bitrate. It cannot be saved to external memory cards. It does not sync automatically with cloud services like Dropbox. All this can lead to a space crunch on phones with limited internal memory. Also, searching using a hashtag or contact is a bit convoluted and can be easier in the interface. Finally, while the comments and photos are fantastic features, they don't carry the time for easy reference. Hi-Q MP3 Voice Recorder Competition (Free | \$3.99 Full) is your best bet if you want a more traditional, free voice recording app. The simple interface includes three self-sense buttons: Recording, Pause, and Done. It supports only the MP3 file format, but you can select the bitrate for quality and size control. If your camera and phone use different microphones, you can choose whether to use the back or front microphone; And you can choose to record in stereo. Hi-Q also allows you to set up where your files are stored and a minimum amount of free space to maintain your storage. You can also start recording from in the message drawer. If you want to record someone stealthy, you can change the icon to something less suspicious. The only limitation of the free version is that it limits each recording to 10 minutes. The full version includes unlimited recordings as well as a quick start widget. If you don't want MP3, a lightweight voice recorder (free | \$3.99 Pro) includes features similar to Hi-Q and records in AAC, AMR, and PCM audio formats. But, yes, he has awareness. Easy Voice Recorder Pro removes ads, records in stereo, saves external memory cards, supports external microphones, adds folder management and brings shortcuts in the message bar, as well as a handy widget. Skyro Voice Recorder (Free | \$1 Pro) is an amazing app which has something none of the others do: synchrony and cloud storage. Set it up with your Dropbox account and it will automatically transfer your recordings to the cloud; And it can save files to external storage, so you never have to worry about space channels. Skyro also arranges your notes chronologically, geographically tags them automatically, allowing you to assign text tags for easy browsing and searching. Just in case the app crashes, Skyro also automatically saves the recording. Pro version opens Sync options and the ability to set your MP3 bitrate. Our previous winner, Tape-a-talk (Free | \$1.32 Pro), is still a good voice recorder, especially because of its ability to automatically save and repair recordings if your app crashes or your phone shuts down. For those who want high quality FLAC recordings, RecForge II (free | \$3.99 Pro) is a good app. You can schedule recordings, skip silent parts, and also have basic audio editing tools. There are quite a few other recorders in the Play Store, such as AL Voice Recorder, Voice PRO (\$13.21), Voice & Voice Sound Recorder - ASR, PCM Recorder, All This Recorder (Free | \$3.99), Smart Recorder, eRecorder - Voice Memo Recorder, and many more. But we think one of hanel's choices is better for the basic needs of a voice recording app. The Lifehacker App Guide is a growing new recommendation guide for the best apps and tools in a given number of categories.
